

# Get the most out of fully automated water samplers

Tuesday 15th March 2022, 3.30pm – 4.15pm AEDT

Get the most out of fully automated water samplers

# GoToWebinar interface

The screenshot displays a GoToWebinar interface. The main content area shows a presentation slide titled "Example Presentation" with a navigation menu containing "Products", "Solutions", and "Services". Below the slide is a video player showing two workers in blue uniforms and hard hats standing on a metal structure. The interface includes a top navigation bar, a right-hand control panel, and a bottom status bar. Annotations with blue arrows point to specific features: "Download the presentation and other files here" points to the top right; "Increase/decrease webcam window here" points to the top center; and "Enter your questions here" points to the "Questions" section of the right-hand panel. The bottom status bar shows "INTERNAL", "Slide 1", "05/18/2018", and the "Endress+Hauser" logo.

Industry Manager

**Preeth John**  
Product Manager

## Agenda

---

- What and why - sampling?
- Typical sampling applications
- Challenges in manual sampling
- Introduction to autosamplers
- Challenges in autosampler operations
- Benefits of E+H Autosamplers
- Q&A

## What is sampling?

- Sampling is the first step of a lab or handheld analysis
- Major role in the consistency and accuracy of results

Techniques and resources used for appropriate sample collection and preservation for further analysis

## Standards and Guidelines

- Australian and New Zealand water quality standards (AS/NZS 5667 series)
- Standard Methods for the Examination of Water and Wastewater
- Queensland's Water monitoring and sampling manual
- ISO 5667 International standard (First Edition 1980)
- DIN EN 25667 European standard (1991)
- DIN 4045 Terms for Wastewater (1985)
- DIN 38402 German standard (1985)
  - DIN 38402-11: (new 2007-03)
- NEN 6600 Netherlands standard
- ÖNORM Austrian standard
- Mcerts/E32 UK standard
- ...

## Why is sampling required?

### Compliance with standards and regulations

- Standardisation of analysis and procedures
- GLP (Good laboratory practices)

### Process instrumentation limitations

- Technology
- Return of investment for multiple online measurements

### Analysis complexity

- Sample preparation and conditioning (e.g BOD5)
- Microbiological analysis (human interpretation)

## Typical applications

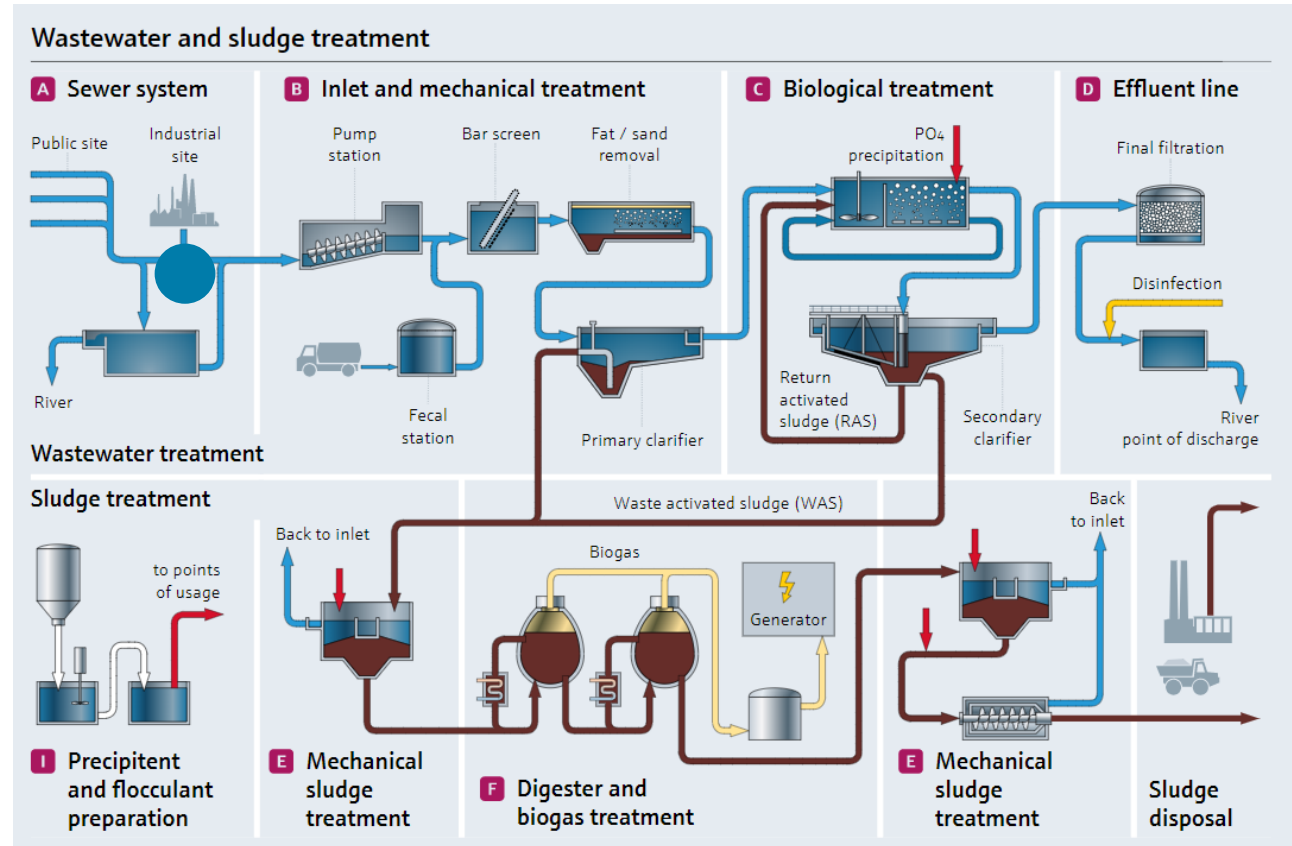

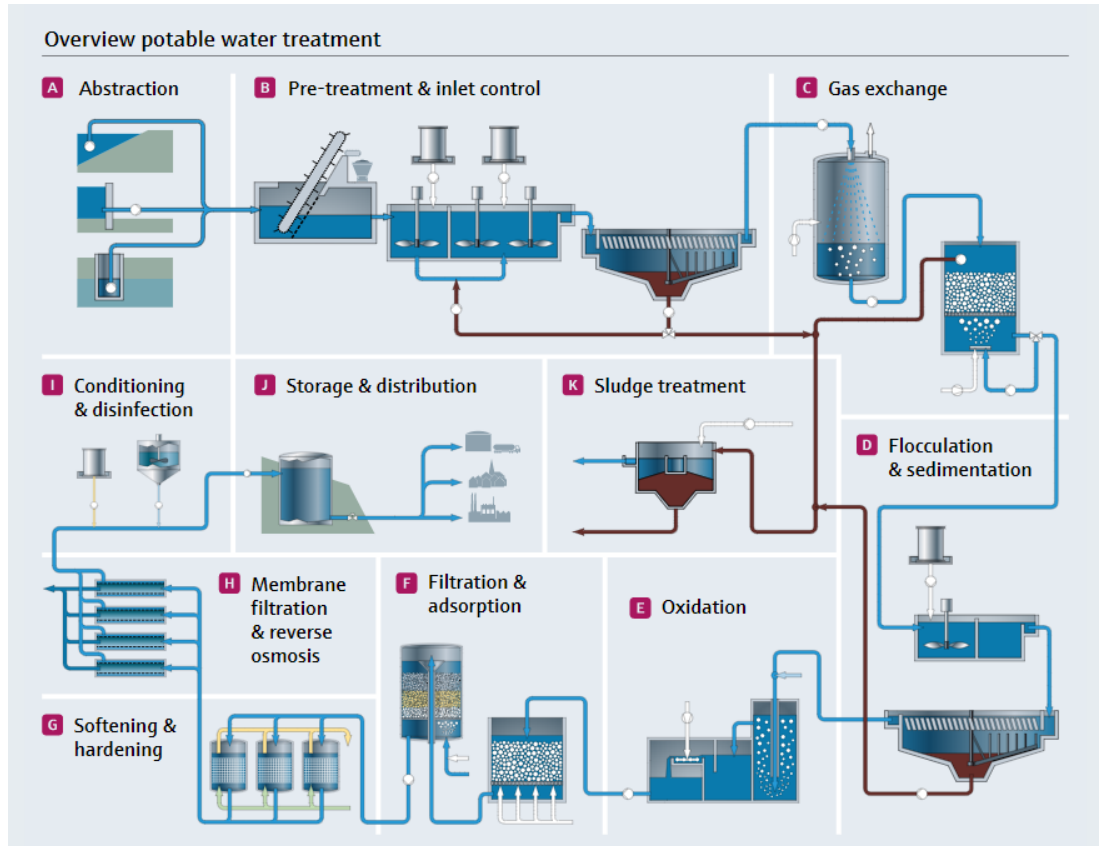

- Evaluation of water quality for discharge permits
- Monitoring of water bodies (e.g rivers, dams)
- Process monitoring
  - Water / wastewater treatment efficiency
  - Identification of product loss
  - Anomalies detection
- Outbreak detection (e.g. COVID-19)

# Challenges in manual sampling

## Challenges in manual sampling

### Safety

- Working close to water bodies
- Exposure to chemicals and biological hazards

### Quality

- Risk of sampling non-conformities
  - Contamination
  - Not enough volume
  - Sample mixing
- Unstable variables (e.g free chlorine, pH, temperature)

### Costs

- High wages
- Logistics time
- Personnel training

## Manual sampling costs - Example

### Scenario 1 – Grab sample

- Cost per hour: \$ 35
- Sampling time: 3 minutes
- Logistics time: 10 minutes
- Number of samples per day: 5

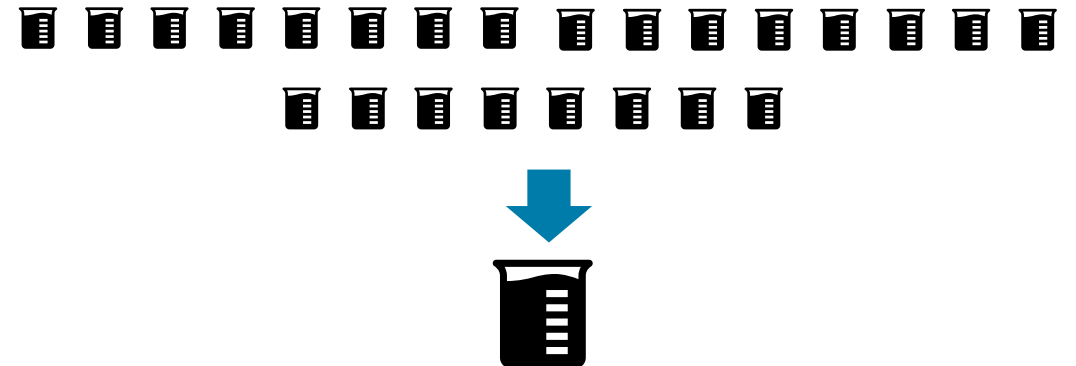

Yearly costs: **\$ 13,838.60**

### Scenario 2 – Composite sample

- Cost per hour: \$ 35
- Sampling time: 3 minutes
- Logistics time: 10 minutes
- Number of samples per day: 24

Yearly costs: **\$ 55,358.33**

## POLL – In your opinion, what is the main challenge in manual sampling?

---

# Introduction to autosamplers

# Operation & Technology

- Nitrate/ SAC
- Turbidity
- ISE
- Conductivity Ind/Con.
- pH
- ORP
- Diss. oxygen amp.
- Chlorine

## Operation & Technology

### Stationary Samplers – with Pump

Get the most out of fully automated water samplers

## Operation & Technology

### Stationary Samplers – with In-Line Assembly

Get the most out of fully automated water samplers

## Operation & Technology

### Portable Samplers – with Pump

## Operation Modes

---

An example of a system with Flow rate vs Time

Time Dependent:

- Equal time intervals, constant sample volume

Volume Dependent:

- Variable time intervals, constant sample volume

Flow Rate Dependent:

- Equal time intervals, variable sample volume

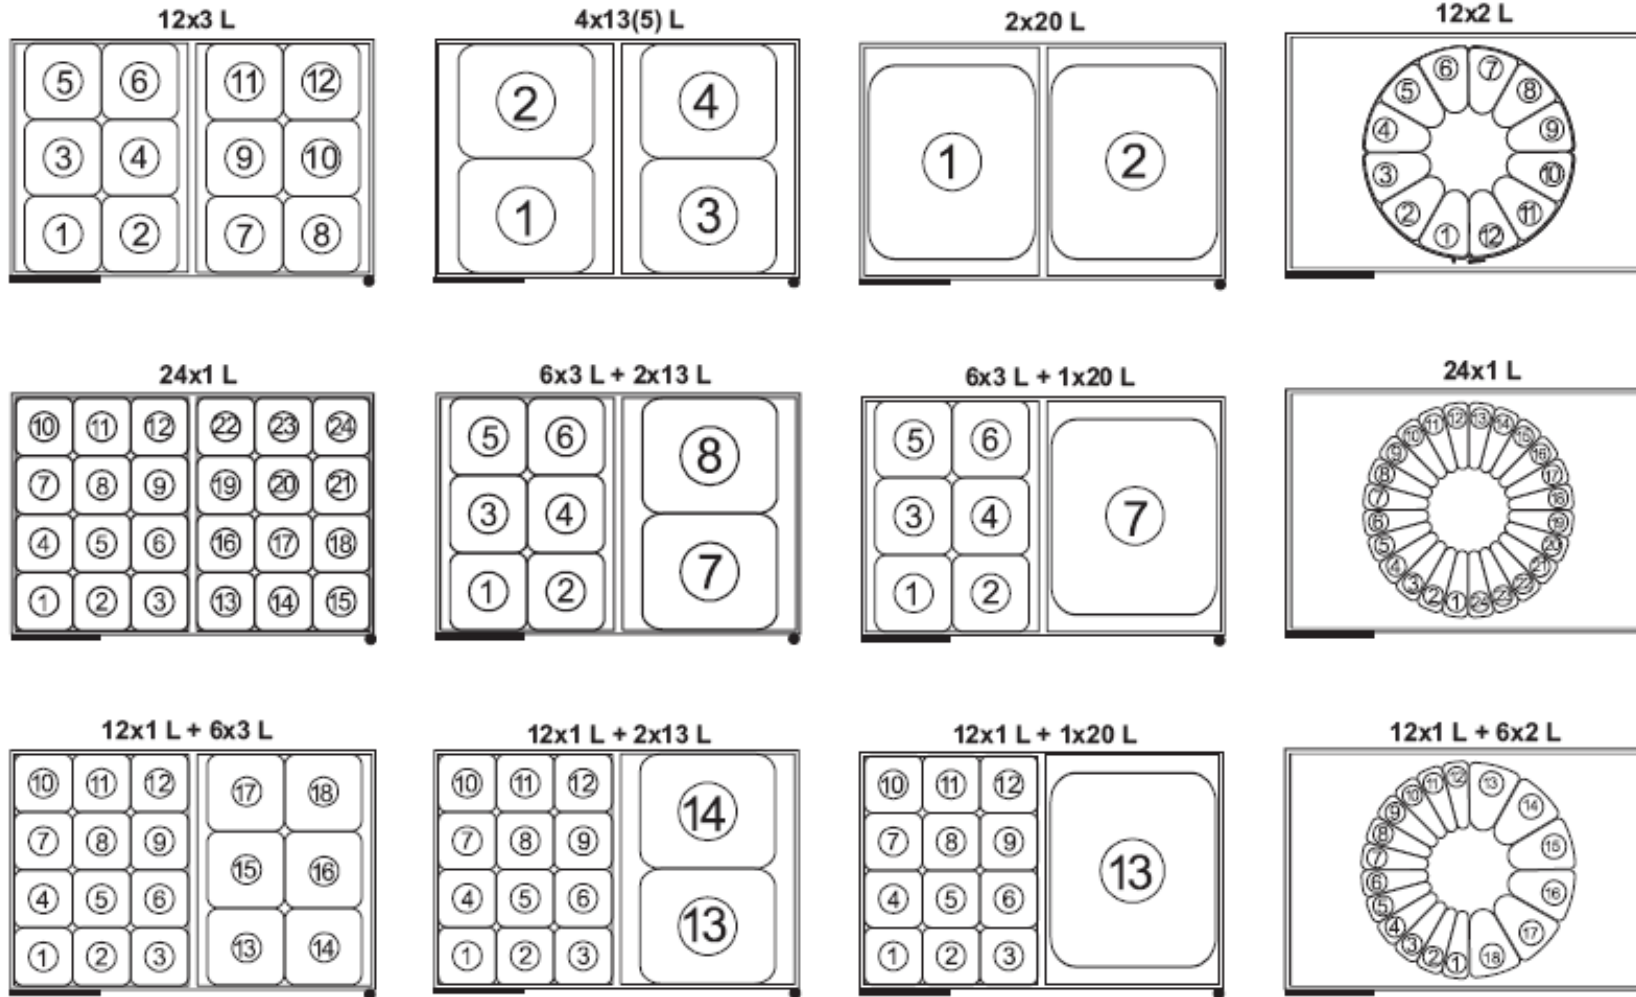

## Operation Modes

### Event Controlled:

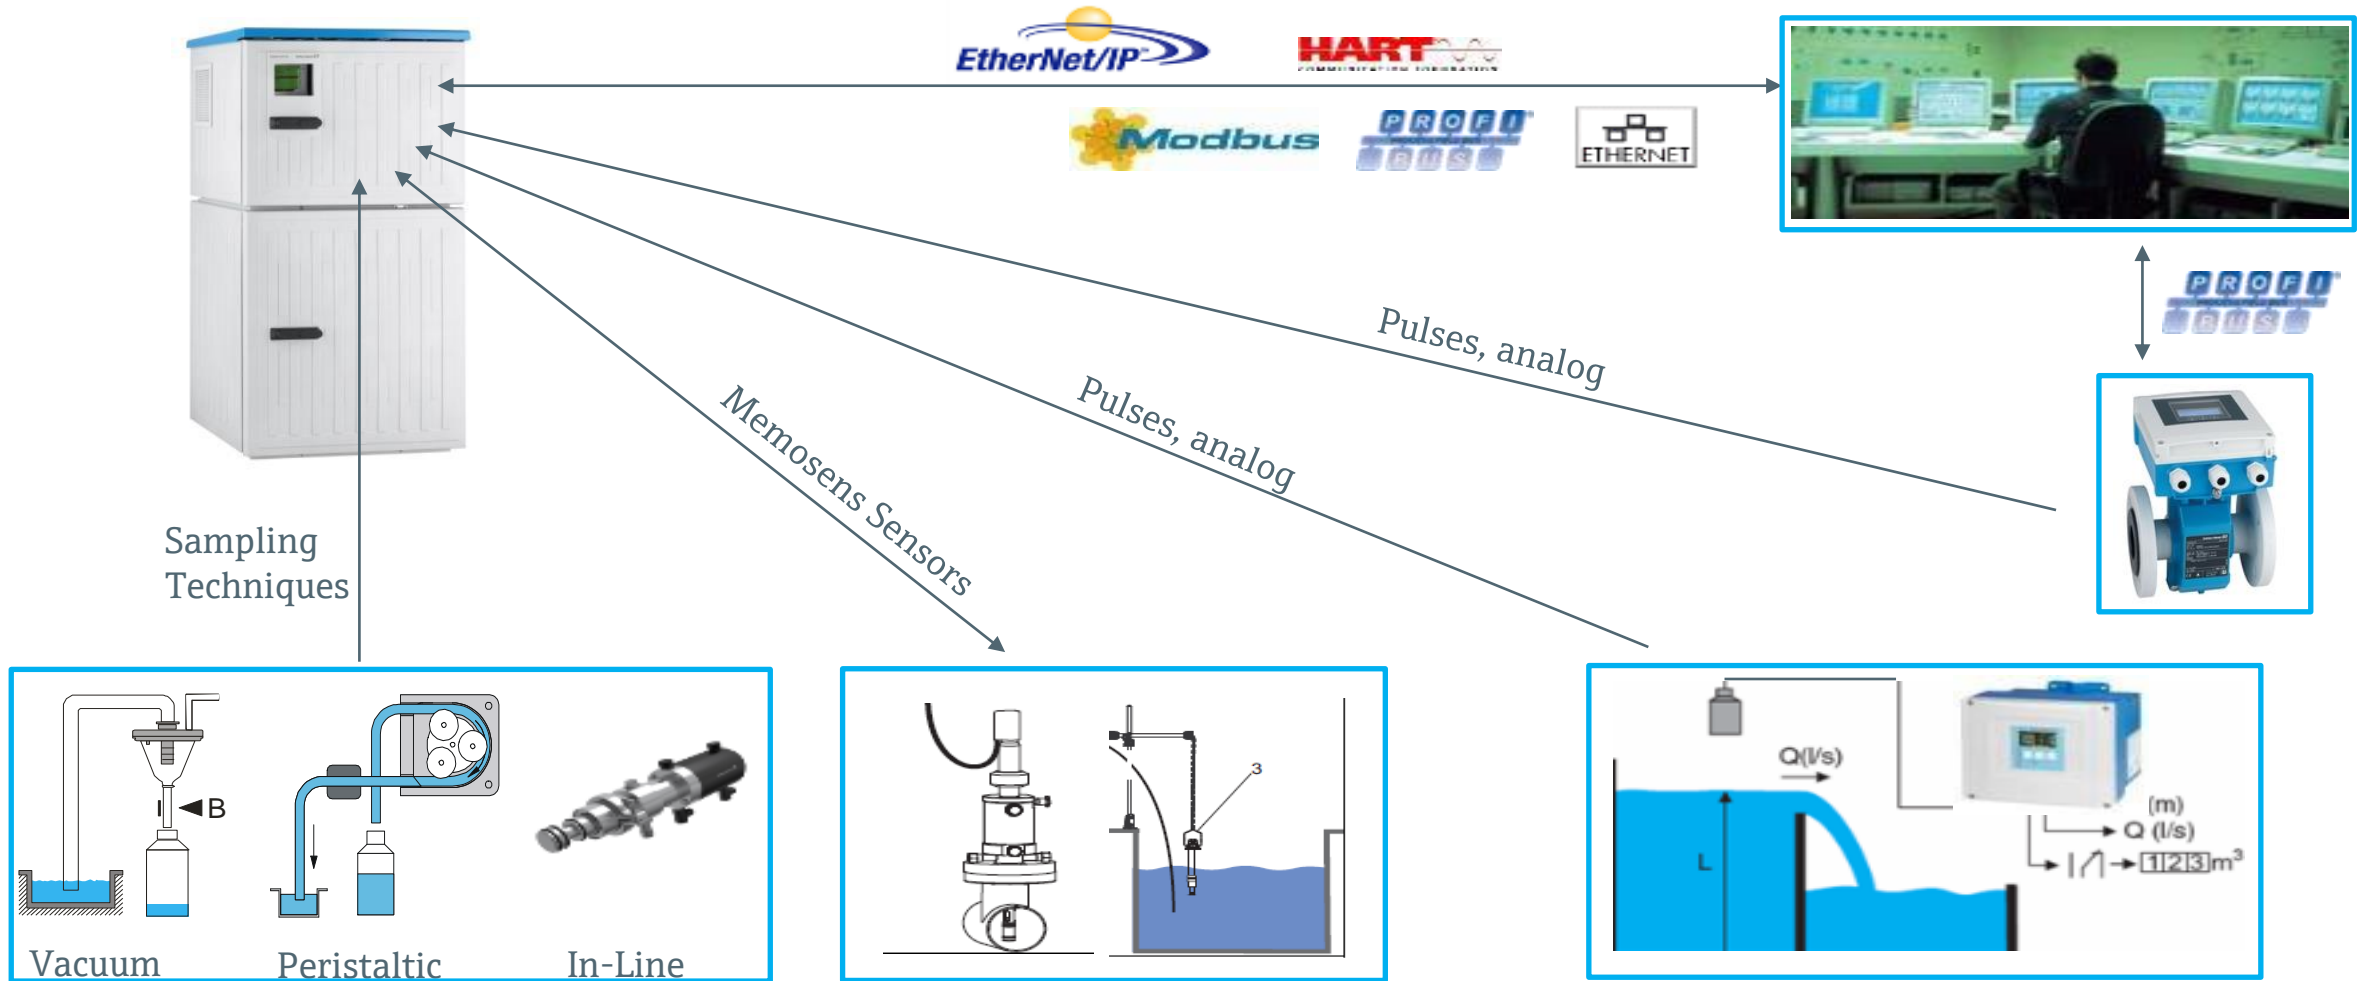

- Alarm samples: The Sample is taken as soon as a certain value (eg: flow rate) is exceeded
- This mode makes monitoring and sampling possible with a single instrument only

## Unique bottle Configurations

# Autosampler Summary

## POLL – What is the aim of sampling in your process?

---

# Challenges in autosampler operations

## Challenges in Autosampler Operations

How do I measure unstable variables? e.g pH, temperature, dissolved oxygen, etc.

How do I know if my autosampler is fully operational?

How to plan the maintenance of my autosampler?

## Memosens Technology

- Inductive coupling between cable and sensor, no open contacts Criticality of analogue systems is totally gone!
- Bidirectional data transmission between sensor and transmitter Transfer of energy to the sensor head by inductive principle
- Calibration data are stored in the sensor head directly, therefore allowing calibration in the laboratory
- While operating, the sensor stores a numerous amount of different operational data in the sensor head for assessment and evaluation

## Challenges in Autosampler Operations

How do I measure unstable variables? e.g pH, temperature, dissolved oxygen, etc.

How do I know if my autosampler is fully operational?

How to plan the maintenance of my autosampler?

# Application examples

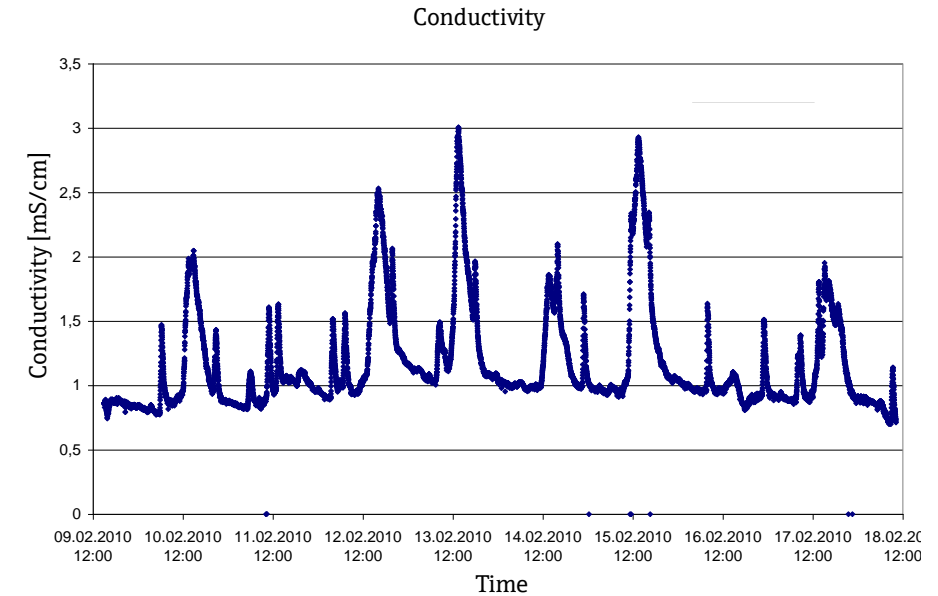

## Sampler – Daily Work

**Sampling application:** Municipal WWTP (Germany)

**Sampling point:** Inlet channel after screen

### Application summary

- Sampling routine program activated with binary impulse
- Sampling Program: Advanced, 1x routine + 1x event
  - Sampling interval: 50m<sup>3</sup>, > 2mS/cm
  - Bottle change mode: 2h routine program
  - Setup: 12x 1 liter + 1x 20 liter
  - Sampling volume: 40ml, event programs multiplier 2x

conductivity inlet value by road deicing  
(delay of sewer transport time)

## Sampler – Daily Work

**Sampling application:** Industrial WWTP

**Sampling point:** Inlet channel after screen

### Application summary

- Sampling routine program activated by time
- Sampling Program: Basic, 1x routine
  - Sampling interval: 15 minutes
  - Setup: 1x 30 liter
  - Sampling volume: 100ml

Composite sample bottle

## Sampler – Daily Work

**Sampling application:** Industrial WWTP

**Sampling point:** Effluent channel to sea

### Application summary

- Sampling routine program activated by flow pulses
- Sampling Program: Basic, 1x routine
  - Sampling interval: 50 m<sup>3</sup>
  - Setup: 4x 13 liter
  - Sampling volume: 50ml
  - Bottle change: 24 h

Get the most out of fully automated water samplers

## Sampler – Daily Work

**Sampling application:** Municipal WWTP

**Sampling point:** WWTP Inlet

### Application summary

COVID-19 Outbreak monitoring

- Sampling Program: Basic, 1x routine
- Sampling interval: 15 minutes
- Setup: 1x 30 liter
- Sampling volume: 100ml

An Endress+Hauser Company

## Benefits of E+H Autosamplers

---

### ■ Safety

- Reduction of human exposure to hazardous conditions and environments
- No contact with samples

### ■ Cost Savings

- Reduce multiple sampling to one simple bottle replacement a day\*
- No re-sampling

### ■ Quality

- Real-time measurement of unstable variables
- High reproducibility
- Event-triggered operation
- Data logging – Events, samplings

# Questions?
